

1. Introduction

- Neural artistic style transfer by Gatys et al. (2015) [A]

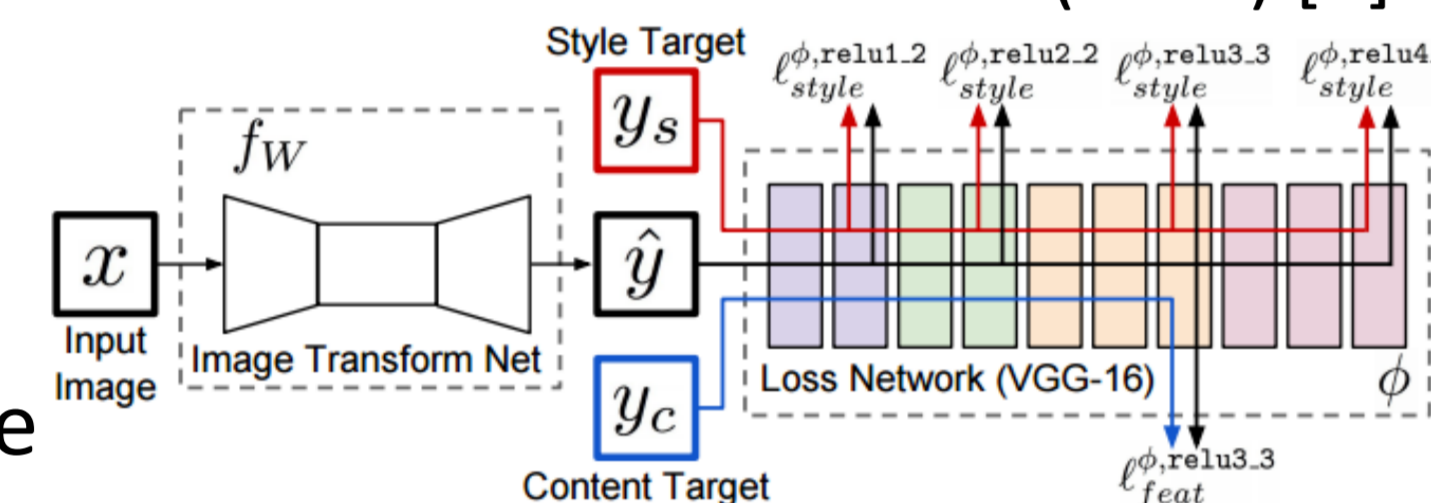

– Optimization-based method \Rightarrow **time consuming** (1 min or more)

- Feed-forward fast style transfer network by Johnson et al. (2016) [B]

– train a feed-forward Conv-Deconv network with perceptual loss

– train only one fixed style

\Rightarrow **need to train an individual model for each style image**
 e.g. ten styles \Rightarrow ten models

Multiple style feed-forward network is desirable!
[idea 1] Conditional fast style transfer network

\Rightarrow However, only trained styles can be transferred.

Unseen style transfer feed-forward network is better!
[idea 2] Unseen style transfer network
 (an extension of a conditional fast style transfer network)

2. Conditional Fast Style Transfer

- Add a style condition input to ConvDeconv network.

- Add a fusion layer and a style input
- Style input: one-hot conditional vector
 e.g. style1 [1,0,0,0,...], style2: [0,1,0,0,...], style3: [0,0,1,0,...]...
- Base network: Johnson's ConvDeconv network [B]
 Each layer has BN and ReLU except last one.

Conditional Fast Style Transfer Network

- Training
 - Perceptual loss with VGG16 (same as Johnson's work [B])
 content: conv3_3, style: conv1_2, c2_2, c3_3, c4_3
 - Each mini batch : one content image + all the style images
 (= multi-style version of Instance Normalization)

Generating stylized images in three ways

- Input: content image + style condition vector
- Single style: one-hot vector [1,0,0,0,...], [0,1,0,0,...]
 - Mixed style: multiple-style-weighting [1,1,1,...], [0.2, 0.1, 0.8,...]
 - Spatial mixed style :

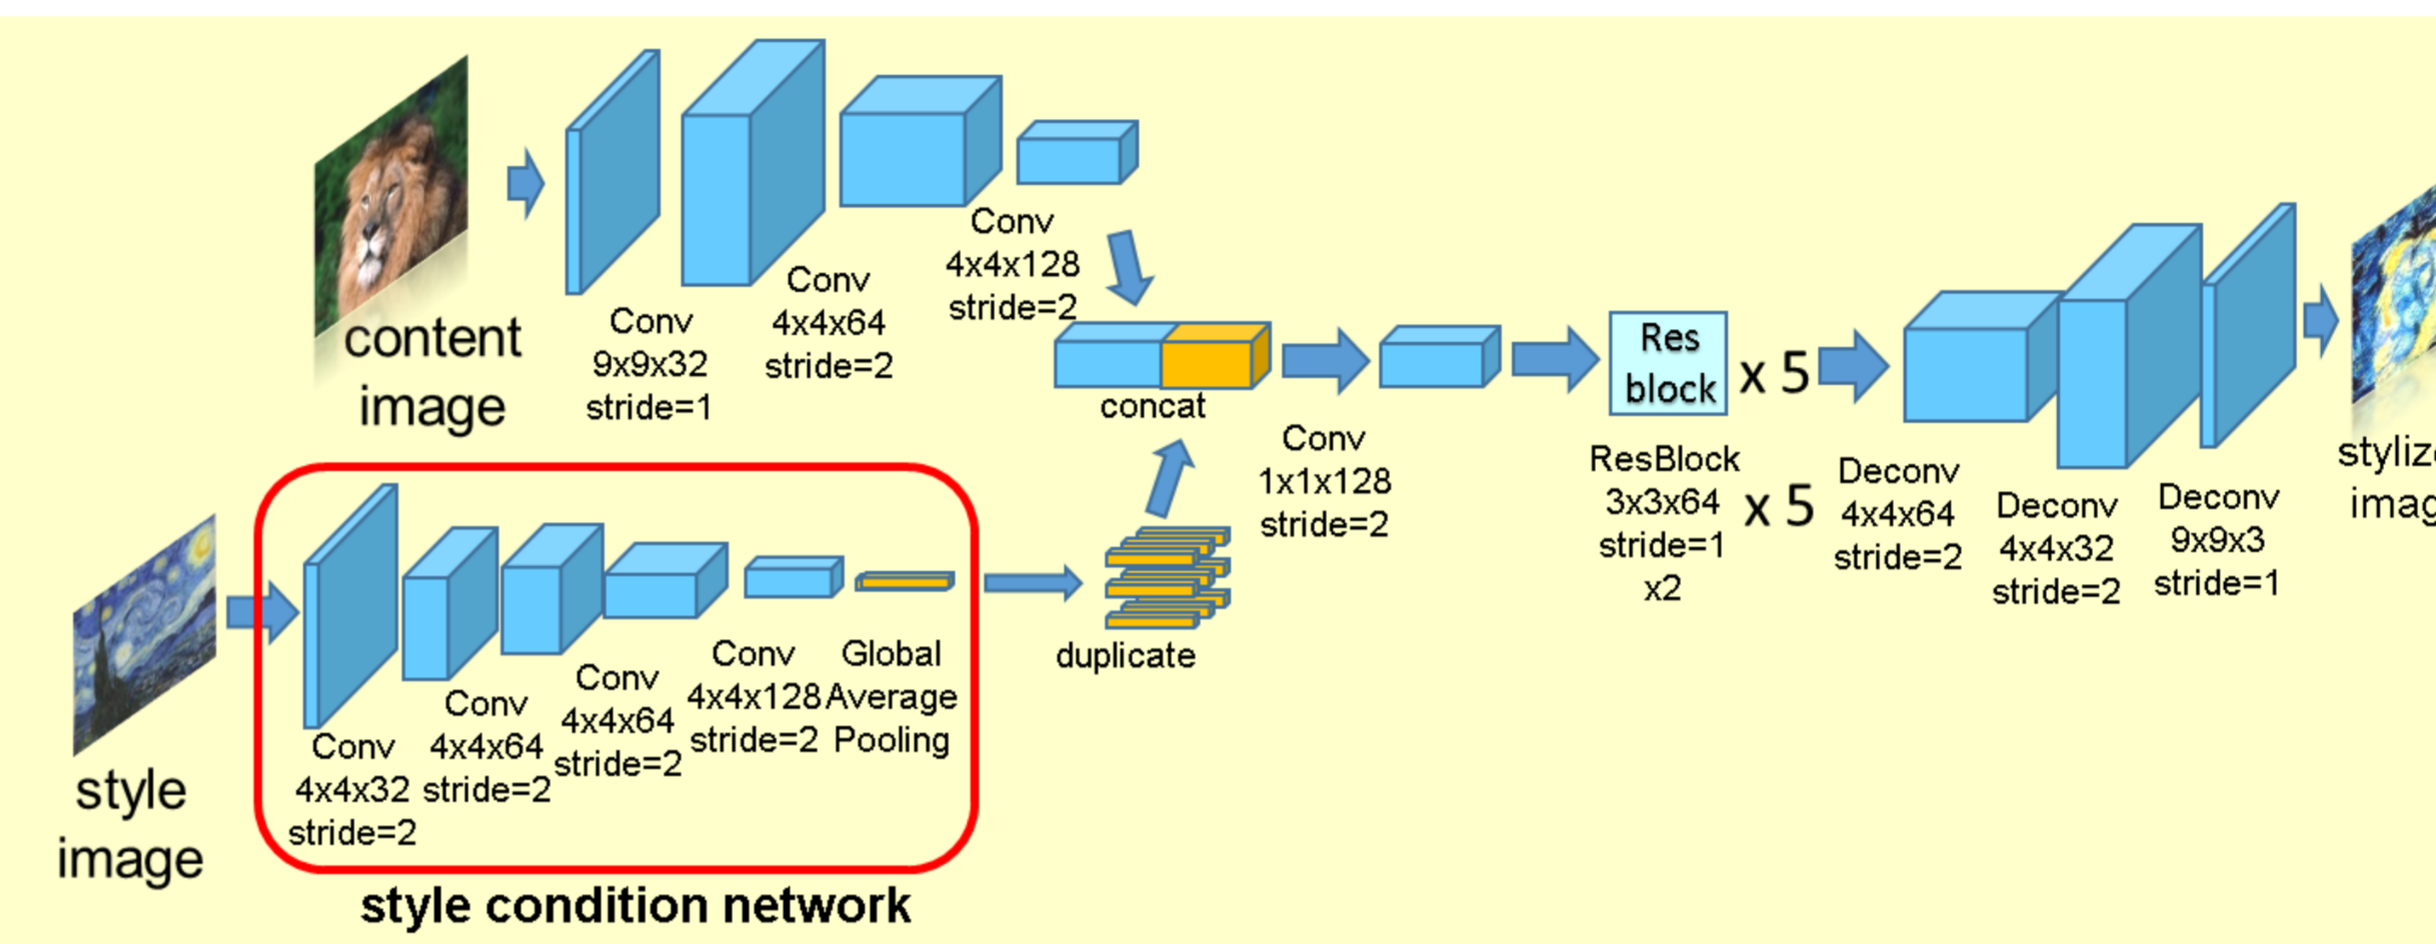

Results of a cond. style transfer with trained styles

3. Unseen Style Transfer Network

- Add a style condition network to the cond. FST network.

- Confirmed that a real-value condition vector is possible.
 Style cond. vec. can be generated by a CNN (not only hand)
- Propose a style condition network which generates a style condition vectors from a given style image directly.
- As a result, "Unseen Style Transfer Net" got possible !!

Conditional Fast Style Transfer Network with a Style Condition Network

Unseen Style Transfer Network

- Training
 - End-to-end training with perceptual loss
 - Each mini batch : one content image + randomly selected style images from 50,000 style images
- Generating stylized images in three ways
 - the same way as a Conditional Fast Style Transfer Network

Results of unseen style transfer with NOT-trained styles
